

# Lean and audit-compliant SAP data storage

## Business Case

**Audit-compliant storage of SAP archive files, documents and print lists:**  
SAP archive files, documents and print lists should be stored in fixed content store or in the cloud. A content management system (e.g. OpenText) is to be replaced by a cost-effective, simple solution for audit-compliant storage. At the same time, a GDPR-compliant storage system should be implemented.

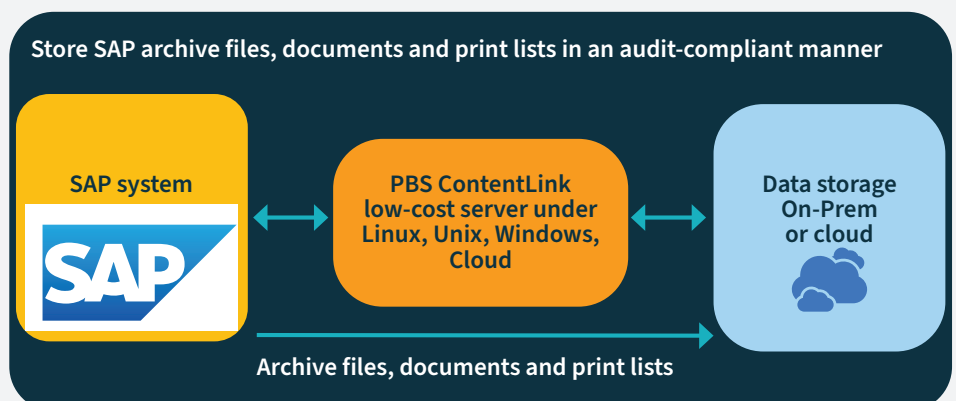

### THE ADVANTAGES

- Monitored through SAP, no separate user interface required
- Provides full support for SAP Retention Management and is therefore an important module for complying with the GDPR requirements
- Retrieve stored data, documents and print lists via the SAP system
- A special caching option speeds up the access to the SAP archive files (ADK), data compression for an optimal use of the storage platform.
- ContentReader: Use the SAP GUI or Fiori App to browse and search for data
- Simple installation, minimal administration effort

### THE SOLUTION

- Lean interface solution to directly connect modern fixed content or cloud storage systems to SAP systems without using a dedicated database (supports all hyper-scalers and leading storage providers)
- Cloud-based operation possible
- Supports SAP ArchiveLink and WebDAV 3.1
- Certified by SAP SE for ERP and S/4HANA
